

Scenario:

Nola Honeycutt is a 47 year-old, caucasian, perimenopausal woman. She is been experiencing awful vasomotor symptoms such as hot flushes and vaginal dryness. Her physician recommends estrogen replacement therapy and begins to discuss treatment options with Premarin and Estrace. However, she is uneasy about taking the Premarin, Estrace, and other synthetic estrogens because of the increased risk of breast cancer. Nola asks her physician for a prescription for the "natural estrogens" that she heard a doctor talk about on Oprah because "they don't cause breast cancer".
